Model assessment: Cross-validation

Fits k models for $n > k$ datapoints, each leaving n/k datapoints out for testing.

+ Uses all data to train models
+ Yields multiple estimates of out-of-sample error
- Different choices of k (and exact splits) yields different results
- **No longer a single model from which information (e.g. parameter estimates and p-values) can be derived**

Model assessment: The bootstrap

Model assessment: Train/validation/test

Nested cross-validation
