Area under the receiver operating characteristic curve (AUC/AUROC)

- A performance metric that does not rely on a correct classification threshold
- Measures whether the predictions are ranked correctly (e.g. patients have a higher prediction than controls)
- **Handles class imbalance (relatively well)** and is commonly reported in the literature

Loss functions and performance metrics: Summary

Performance metrics and loss functions measure the performance of a predictive model

- There is a range of alternatives that can be used, each capturing a different aspect of a model's performance
- It is good practice to report more than one metric
- For regression:
 - MSE is a common loss function with nice mathematical properties.
 - MAE is an intuitive performance metric
- For classification:
 - Log-loss is the most common loss function for probabilistic classifiers
 - AUC is a widely used metric that is easy to interpret, handles class imbalance (to some degree), and is not reliant on the choice of classification threshold

Loss functions and performance metrics: Summary
