PSY9511: Seminar 4

Testing, resampling, and splitting

Esten H. Leonardsen 26.10.23

Model assessment: Cross-validation

Fits k models for n > k datapoints, each leaving n/k datapoints out for testing.

- + Uses all data to train models
- + Yields multiple (correlated!) estimates of out-of-sample error, which can be used to fit a distribution
- Different choices of k (and exact splits) yields different results
- No longer a single model from which information (e.g. parameter estimates and p-values) can be derived

Model assessment: The bootstrap

Model assessment: Train/validation/test

Nested cross-validation
